

CLAIMS

1. In an electric motor having a shaft, a bearing located within a housing adapted to be filled with lubricant, and passages communicating the shaft and the bearing, the improvement comprising:
- at least one centrifugal lubricant pump stage located in the housing, the pump stage having an impeller attached to and rotating with the shaft and a mating diffuser for pressurizing the lubricant; and
- a flow passage leading from the lubricant pump stage to the bearing.
2. The apparatus of claim 1, wherein:
- the at least one pump stage further comprises a second pump stage having an impeller and a diffuser mounted in the housing downstream of the first pump stage for further pressurizing the lubricant.
3. The apparatus of claim 1, wherein:
- the diffuser is upstream of the impeller.
4. The apparatus of claim 1, wherein:
- the pump stage is oriented for discharging lubricant in an opposite direction from the bearings.

1 5. The apparatus of claim 1, wherein:

2
3
4
5
6
7
8 the impeller of the pump stage has substantially radial flow passages.

6. The apparatus of claim 1, wherein:

8 a chamber is located in a lower portion of the housing for containing a volume of lubricant;

9
10 the shaft is hollow and has a passage within for communicating fluid from the chamber to
11 the bearings; and

12
13 the pump stage discharges downward.

7. An electric submersible pump assembly for a well, the assembly comprising:

17 an electrical motor having a shaft, a bearing located within a housing adapted to be filled
18 with lubricant, and passages communicating the shaft and the bearing;

19
20 a chamber located in a lower portion of the housing for containing a volume of lubricant;

21
22 a flow passage within the shaft leading from the chamber to the bearing;

23
24 first and second centrifugal lubricant pump stages, each pump stage located in the housing
25 and each having an impeller attached to and rotating with the shaft and a mating diffuser for
26 pressurizing the lubricant; wherein
27
28

1 the diffuser in the first pump stage leads to the impeller in the first stage, the impeller of the
2 first stage leads to the diffuser of the second stage, the diffuser of the second stage leads to
3 the impeller of the second stage, and the impeller of the second stage leads to the chamber;
4 and
5

6 a pump exterior of the motor and connected to the shaft for pumping well fluid.
7
8

9 8. The assembly of claim 7, wherein:

10 the impellers of the pump stages have substantially radial flow passages.
11
12

13 9. The assembly of claim 7, wherein:

14 the pump stages discharge downward and are located in a lower portion of the housing.
15
16

17 10. A method of stabilizing a bearing in a motor having a hollow shaft and passages
18 communicating the shaft and the bearings, the motor having a housing containing a volume
19 of lubricating fluid, the method comprising:
20
21

22 mounting at least one lubricant pump stage to the shaft within the housing, the pump stage
23 having an impeller and a diffuser;
24

25 rotating the shaft and the impeller, pressurizing the lubricating fluid with the pump stage to
26 a pressure sufficient to induce a film of lubricating fluid between the shaft and the bearings,
27 the film preventing the shaft from contacting the bearings, thus stabilizing the bearings.
28
29

1 11. The method of claim 10, wherein:
2
3 the pressure in the hollow shaft is at least 30 pounds per square inch.
